Amendments to the Claims:

Please cancel claims 15-22 without prejudice. Please amend claims 1, 3-6, 13-14, 23, 29, and 34-36 as follows:

1. (currently amended): A method of mapping a plurality of tasks and mapping a plurality of data onto a configurable multiple processor, distributed memory hardware architecture, the method comprising:

   a) describing a task-level network of behaviors, which characterizes an embedded system, onto a configurable multiple processor and distributed memory hardware architecture, each of the task-level network of behaviors being related to each other through control and data flow;

   b) predicting a schedule of tasks for the task-level network of behaviors; and

   c) allocating the plurality of tasks ~~and data~~ to at least one processor ~~of the multiple processors~~ and allocating the plurality of data to at least one ~~of~~ distributed memory in the configurable multiple processor, distributed memory hardware architecture ~~respectively,~~ in response to the predicted schedule of tasks.

2. (original): The method of claim 1 wherein the predicting the schedule of tasks comprises minimizing execution time of the plurality of tasks.

3. (currently amended): The method of claim 2 wherein the predicting the schedule of tasks comprises minimizing the schedule of tasks by allocating data to ~~the~~ at least one distributed ~~memories~~ memory in the configurable multiple processor, distributed memory hardware architecture in order to minimize data transfers.

4. (currently amended): The method of claim 1 wherein the predicting the schedule of tasks comprises maximizing parallel execution of the plurality of tasks on at least two processors in ~~of~~ the configurable multiple ~~processors~~ processor, distributed memory hardware architecture.

5. (currently amended): The method of claim 1 wherein the allocating the plurality of tasks comprises allocating tasks to at least one processor in ~~of~~ the configurable multiple ~~processors~~ processor, distributed memory hardware architecture, which has ~~having~~ optimal processor resources for the tasks.

6. (currently amended): The method of claim 1 wherein the predicting the schedule of tasks comprises using a resource-based model of the configurable multiple processor, distributed memory hardware architecture to predict the schedule of tasks.

7. (original): The method of claim 1 wherein the predicting the schedule of tasks comprises using an interval graph and an execution time model of the task-level network of behaviors to predict the schedule of tasks.

8. (original): The method of claim 1 wherein the allocating the plurality of tasks and data comprises an iterative allocation process.

9. (original): The method of claim 8 wherein the iterative allocation process comprises using a demand-driven and constraint-based objective function.

10. (original): The method of claim 1 wherein the describing a task-level network of behaviors comprises describing a task-level network of behaviors in a high-level programming language.

11. (original): The method of claim 10 wherein the describing the task-level network of behaviors in the high-level programming language comprises parsing the high-level programming language into an intermediate form.

12. (original): The method of claim 1 further comprising generating machine executable code for the multiple processor, distributed memory hardware architecture based at least in part on the allocating the plurality of tasks and data.

13. (currently amended): The method of claim 1 wherein the allocating the plurality of data to the at least one distributed ~~memories~~ memory in the configurable multiple processor, distributed memory hardware architecture comprises allocating data to shared memories.

14. (currently amended): The method of claim 1 wherein the allocating the plurality of data to the at least one distributed ~~memories~~ memory in the configurable multiple processor, distributed memory hardware architecture comprises allocating data to private memories.

15. (withdrawn): A method for generating a control graph for a compiler used to map a plurality of tasks and data onto a multiple processor, distributed memory hardware architecture, the method comprising:

a) parsing a plurality of tasks into an internal compiler form of interconnected task nodes; and

b) linking a compiler representation to each interconnected task node using directed edges for the purpose of substantially simultaneously mapping the tasks to multiple processors in the multiple processor, distributed memory hardware architecture.

16. (withdrawn): The method of claim 15 further comprising binding the interconnected task nodes to the directed edges.

17. (withdrawn): The method of claim 15 further comprising parsing a plurality of data blocks into an internal compiler form of data nodes and linking a compiler representation to each data node using directed edges.

18. (withdrawn): The method of claim 15 wherein the directed edges represent time intervals.

19. (withdrawn): The method of claim 18 wherein the time interval comprises the time period between tasks.

20. (withdrawn): The method of claim 18 wherein the time interval comprises the time period from beginning a task to ending a task.

21. (withdrawn): The method of claim 18 wherein the time interval comprises a set time period.

22. (withdrawn): The method of claim 18 wherein the time interval comprises a time period between time periods.

23. (currently amended): A method for executing a schedule of tasks in a configurable multiple processor, distributed memory architecture, the method comprising:

a) generating the schedule of tasks based at least in part on a task-level network of behaviors, which characterizes an embedded system;

b) calculating a demand function based at least in part on a constraint related to at

least one of a plurality of tasks in the schedule of tasks; and

c) allocating a task having highest priority to a processor having least cost according to the demand function.

24. (original): The method of claim 23 further comprising allocating a data block to a memory in the distributed memory.

25. (original): The method of claim 23 wherein the demand function is calculated based at least in part on the task-level network of behaviors.

26. (original): The method of claim 23 wherein the demand function is calculated based at least in part on an impact on the schedule of tasks.

27. (original): The method of claim 23 wherein the demand function is calculated based at least in part on an impact on data movement.

28. (original): The method of claim 23 wherein the demand function is calculated based at least in part on prior allocation decisions.

29. (currently amended): The method of claim 23 wherein the cost is defined as ~~the~~ a least negative impact on at least one performance factor.

30. (original): The method of claim 29 wherein the at least one performance factor comprises the schedule of tasks.

31. (original): The method of claim 29 wherein the at least one performance factor comprises data movement.

32. (original): The method of claim 23 further comprising allocating a task having next highest priority to a processor having next least cost according to the demand function.

33. (original): The method of claim 23 further comprising recalculating the demand function in response to each task in the plurality of tasks being allocated to a processor.

34. (currently amended): A compiler for mapping a plurality of tasks and data onto a configurable multiple processor, distributed memory architecture, the compiler comprising:

a) means for describing a task-level network of behaviors, which characterizes an embedded system, each of the task-level network of behaviors being interrelated through control and data flow dependencies;

b) means for predicting a schedule of tasks for the task-level network; and

c) means for allocating the plurality of tasks and data to at least one ~~of~~ processor ~~the multiple processors~~ and to at least one ~~of the~~ distributed memory ~~memories~~ in the configurable multiple processor, distributed memory architecture, respectively, in response to the predicted schedule of tasks.

35. (currently amended): The method of claim 34 further comprising a means for producing machine executable code for the configurable multiple processor, distributed memory hardware architecture based at least in part on the means for allocating the plurality of tasks and data.

36. (currently amended): The method of claim 34 wherein at least one processor in the

configurable multiple processor, distributed memory architecture ~~the multiple processors~~ communicates using ~~the~~ at least one distributed ~~memories~~ memory in the configurable multiple processor, distributed memory architecture.
